

search (Q)
 search what you need (explain in your words)
 and ai brings the graph.

✓?
 { unlimited information need to be visualized by ai.
 so like a blockchain everyone can contribute to the database of nodeledge
 actually not them rather, their ai agents, by simply generating visualizations (maybe even knowledge nodes)

but my first objection is to create a free community that makes learning "easier" with visualizations.
 and believe ai is "too" good at spitting out knowledge

new thought
 { or maybe the nodes should be dynamic. they change structure according to the user's
 learning style highly customized nodes but compute heavy or choose between a limited number
 of templates then just apply the knowledge to these templates.

these are connected to them without and
 relevance, only a connection.

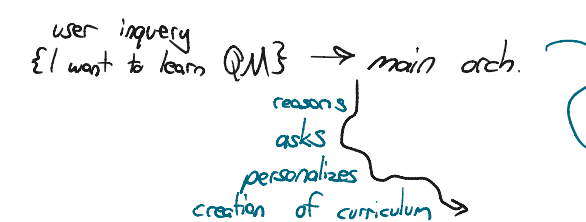

actually the reason i want to create graph to learn
 and utilize AI is because I myself created a curriculum for
 learning quantum mechanics and i tell Claude to explain things with visualizations
 for example visualise "fermionic" but that way is not efficient. If I don't know the
 topic well I cannot guide AI to teach me. Because it just don't know what I don't
 know and cannot explain everything. So if I create a node graph like

chat is a bad interface for learning because of unknown-unknowns
 problem

it is hard to tell Claude everytime "what do i need to learn", "how should we shape the learning process"

- create the resources for graph (Quantum mechanics lectures)
- create the nodes/graph to gather the knowledge

~ another idea ~
 maybe not community but specific to a user

new idea of new idea (maybe I can just publish this as open source and people stick their API to create)
 nodes shouldn't be static. then I can use their pre-generated topics when the user wants to learn that something
 they shouldn't be pre-generated already generated they will be asked "A knownode is generated, do you generate your own?"
 they should be generated dynamically something like that.
 for example user finished first node
